Accountantulator

Problem Statement

As the years go by, our lives get more and more complicated, as seen in the amount of taxes we have to pay and the variety of taxes we have to pay. This can be your salary, the groceries that you bought, the lottery that you won, and even what you inherit from your parents and grandparents. **The problem is that it gets very annoying and costly to see the amount of Pesos you have to pay without knowing how and why you actually pay that amount. Our project aims to help people figure out how they have to pay a certain amount by showing them the formulas used to calculate a certain tax, while also showing them why they pay that amount of tax by allowing them to calculate it themselves.**

Project Objectives

One of the main goals of this project is to help the average person calculate the amount they need to pay for their tax if they cannot afford a personal accountant. This objective should only require the input of the person on a certain subject, such as their income, the amount they inherited, or the price of an item they bought. Moreover, the Accountantulator should be able to calculate all the types of taxes that the average person encounters yearly or monthly. The project also aims to be as simple as possible, with the Interface requiring no more than the type of tax you want to calculate and the required value in that field.

Features

Here are all of the main features that we want to include in the Accountantulator

1. Opening User Interface
 - a. VAT Calculation
 - i. Calculate Product
 - ii. Tutorial for VAT
 - iii. History of Calculation
 - iv. Alter Product
 - v. Find Product
 - vi. Exit

- b. Income Tax
 - i. Calculate Income Tax
 - ii. Tutorial for Income Tax
 - iii. History of Calculation
 - iv. Find Income Tax
 - v. Alter Income Tax
 - vi. Exit
- c. Exit

Inputs and Outputs

Firstly, we have added that once a person opens up the Accountantulator, it should output the Opening User Interface, and we plan that if a person selects the first option, the VAT calculation part, it should directly all the options for VAT, such as the actual calculation, tutorial for the calculator, the history ,and more. Once that is accomplished, we plan that the user should input the option that they want for the Accountantulator to start. Once they have completed filling up the required data in the specific option they picked, what the Accountantulator should output is either a history of products calculated, or a specific product calculated. If the user picks the second option, the Income Tax calculation part, it should show the same option as in the VAT calculator part, except it calculates Income Tax, and it does not include the tutorial, because it only requires your name and income as an input. Lastly, if you pick the third option; you will exit the program.

Pseudocode

```
Print("Welcome to Accountantulator")
Option =Input("Menu Options:
    1: Calculate VAT of product,
    2: History of your Accountantulator,
    3: Tutorial,
    4: Find a Product,
    5: Alter a Product,
    6: Exit Accountantulator)

If Option == 1:
    Newproduce= {}
    Newleproduce[Username]=Input("What is your name")
    Newproduce[Name]=Input("What is the name of the Product")
    Newproduce[Price]=Input("What is the price you bought this for?")
    Newproduce[VAT]=Sampleproduce[Price] x 0.12
    Print("The vat for the product is [VAT]")
    New[MinimumPrice]=New[Price] + New[VAT] +0.1
```

```

Print("For you to earn money you must price it at [MinimumPrice]")
New[MarketPrice]=input("What do you want to price it at")
New[Profit]=New[MarketPrice] -New[Price]
Print("The profit you make is [Profit]")
New[Creation]= "Tutorial by User"
NewHistoryTag]= 1
Json.Append(Newproduce)

```

Elif Option == 2:

```

For Product in JSON:
    For I in Product:
        Print(f"(I.Capital): (Product(I))")
    Print("")

```

Elif Option == 3:

```

Sampleproduce= {}
Print("Here is a tutorial on how to use the Accountantulator")
Sampleproduce[Username]=Input("What is your name")
Sampleproduce[Name]=Input("What is the name of the Product")
Sampleproduce[Price]=Input("What is the price you bought this for?")
Sampleproduce[VAT]=Sampleproduce[Price] x 0.12
Print("The vat for the product is [VAT]")
Sampleproduce[MinimumPrice]=Sampleproduce[Price] + Sampleproduce[VAT] +0.1
Print("For you to earn money you must price it at [MinimumPrice]")
Sampleproduce[MarketPrice]=input("What do you want to price it at")
Sampleproduce[Profit]=Sampleproduce[MarketPrice] -Sampleproduce[Price]
Print("The profit you make is [Profit]")
Sampleproduce[Creation]= "Tutorial by User"
Sampleproduce[HistoryTag]= 0
Print(Sampleproduce)

```
